1 Introduction

In this paper, we will show how semantics and pragmatics reduce to syntax (or the other way around, see Kamp 1973; Searle 1964) ...

2 Typesetting stuff

Here, we show how frequently needed linguistic elements can be typeset in L^AT_EX. These instructions should cover most of your needs.

2.1 Linguistic examples with glosses and translations

For examples, use `linguex`, and for glossing morphological categories, please refer to the Leipzig Glossing Rules.

(1) Swiss German (Hodler 1969: 346)

win er der Namen Gottes het usgsprochn-a ghabe

when he the name.M.SG God.GEN has pronounced-M.SG had

‘once he had pronounced the name of God’

(2) shows how you can typeset examples with several subexamples. Please avoid, if at all possible, examples that are cut from their translation. You may want to force a new page, if this cannot be avoided. In order to refer back or forth to an example, you can either do it like (2) and (2a), or rather with the shorthands (2c) or (1). Either will work, but only the first version

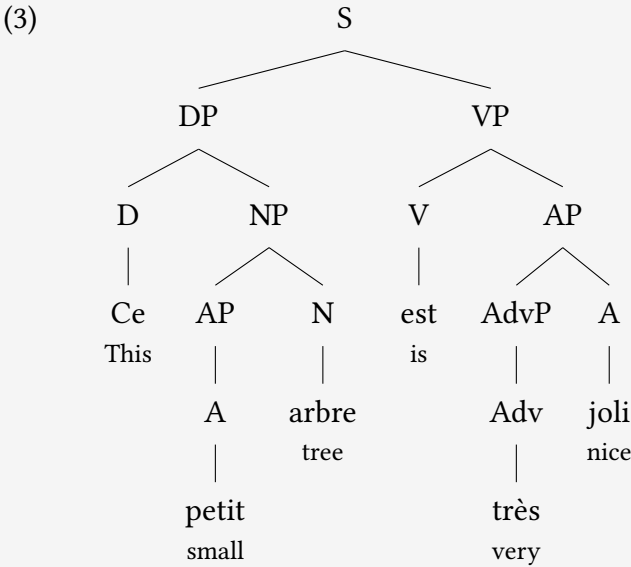

will require that you add a *label* to the example, as we have done below.

- (2) a. First example
- b. Second
- c. *Dies ist ein schönes Beispiel mit einer Glose.*
 This is a beautiful example with a gloss.
 (i) ‘Some translation’
 (ii) ‘Some other’
- d. Fourth

You can refer back to examples like (2) and (2a).

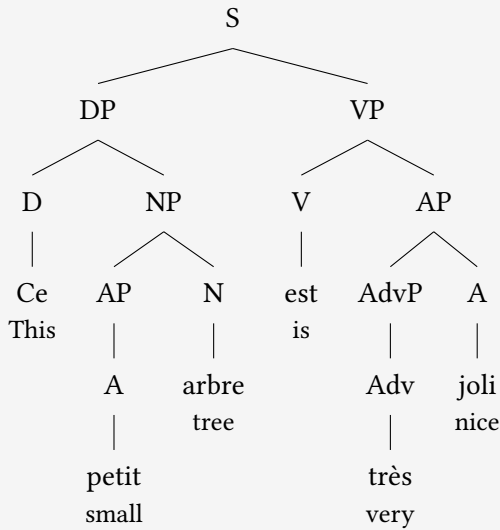

2.2 Trees

In order to make trees, use the **forest** package.

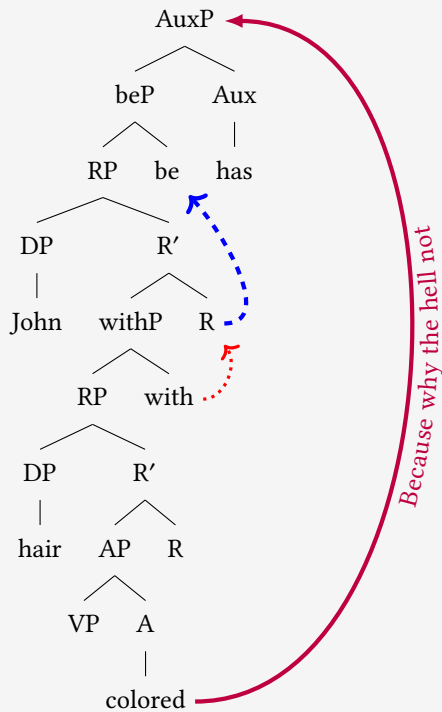

You can also make a more involved example, with arrows, as is illustrated in (5). Ideally, you would want to avoid big spaces (you can adjust the size of the tree, if this is necessary, as we have done in (4) for (3)).

1 (4)

2 (5)

Type of language	Number
No articles at all	198
Both indefinite and definite article	154
Definite, but no indefinite article	89
Indefinite, but no definite article	40
Total	481

Table 1 Article Systems in the World’s Languages according to *WALS*

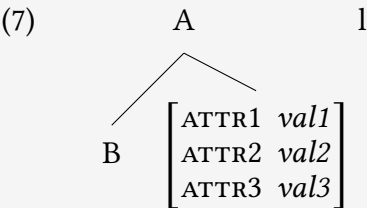

2.3 AVMs

For avms, we use `langsci-avm`.

(6)

$$\left[\begin{array}{cc} \text{ATTR1} & \boxed{1} \\ \text{ATTR2} & \boxed{2} \end{array} \left[\begin{array}{cc} \text{ATTR3} & \text{val3} \\ \text{ATTR4} & \text{val4} \end{array} \right] \right]$$

You can combine `forest` and `langsci-avm`:

2.4 Tables

For tables, we use the `booktabs`-environment, as illustrated in Table 1.

2.5 Figures

And finally, you can also add figures. Figures are floats in `LATEX`, so they might end up on another page. When adding a figure, please make sure that the picture is in a high enough resolution (we recommend 300dpi or more), and that you have the right to include the picture.

As usual, you can refer back to Figure 1.¹

¹Source of the cat: https://commons.wikimedia.org/wiki/File:VAN_CAT.png.

Figure 1 A cute cat and its identical twin (not sure if this is relevant)

2.6 References

For references, we use **biblatex**. You can use the format familiar familiar from natbib. For instance, it is no problem to say that Szadrowsky (1936: 451) claims something, but I am not sure whether Kamp (1973: 70) would agree (or Searle 1964: 50, by that matter).

3 Limitations

As of now, we only support 5 authors. If your paper has more than 5 authors, please get in touch with us.

You can no longer compile to dvi. This is not something we intend to change.

Abbreviations List here the abbreviations you used in your paper. For a list of standard abbreviations, refer to the Leipzig glossing rules. Sort alphabetically, and indicate the abbreviations in the following format: GEN = genitive, M = masculine, SG = singular.

Acknowledgments We thank everyone for their kind advice.
